                                                                                                                                              FUNCTION: Exchanges the guanine residue with 7-aminomethyl-7-deazaguanine in tRNAS with GU(N) anticodons (tRNA-Asp, -Asn, and -Tyr). After this exchange, a cyclopentendiol molety is attached to the 7-aminomethyl group of 7-deazaguanine, result: in the hypermodified nucleoside queuosine (Q) (7-((4,5-cis-dihydroxy-2-cyclopenten-1-yl)amino)methyl)-7-deazaguanosine). CATALYTIC ACTIVITY: tRNA guanine + queuine = tRNA queuine +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               _ZYMMO
